

# Market Meadow P0

Original animal-town production loop - implementation-ready functional specification

|          |                                            |
|----------|--------------------------------------------|
| Feature  | F-001 Market Meadow P0                     |
| Status   | SOURCE READY / EXECUTION LOCKED            |
| Platform | Godot 4.6 - 720 x 1280 portrait prototype  |
| Owner    | Codex /root - producer and P0 source owner |

## Decision and safety boundary

This is an original CityOfAnimals prototype. It uses only a broad genre pattern: grow a resource, convert it in a workshop, fulfill a local delivery, and expand a small town. Township and every other commercial game remain reference-excluded: no names, art, maps, recipes, text, economy, UI hierarchy, layout, assets, or code may be copied.

**Initial runtime visuals are Unicode emoji and original geometric SVG placeholders. Fisher is used only as a user-owned engineering reference for portrait scaling, flat outlined components, clear action states, and reliable hit testing. The CityOfAnimals layout, labels, and content are original.**

## Research gate

- Generic genre-loop research passed: the selected loop is broad, common, and does not rely on protected expression.
- Zhihu research is DEGRADED: direct Jina retrieval timed out and proxy retry failed during Windows TLS credential acquisition. No Zhihu result is used.
- Producer approval is limited to a technical P0. QA review remains required before any user-facing demo claim.

## Player promise

*Plan one tiny production chain, then watch your animal town gain a visibly useful new place.*

A first-time player should finish the loop in under two minutes: plant a Sunseed, collect Grainleaf, make a Meadow Loaf, complete a Market Cart, then unlock a plot.

## Core loop

| Step | Place       | Player-visible result                              |
|------|-------------|----------------------------------------------------|
| 1    | Meadow Plot | Tap an empty plot to sow one Sunseed.              |
| 2    | Growth      | Wait 6 seconds with a visible countdown.           |
| 3    | Harvest     | Tap ripe crop to collect one Grainleaf.            |
| 4    | Crumbworks  | Spend two Grainleaf; queue a 5-second Meadow Loaf. |
| 5    | Collect     | Tap the ready workshop to take the loaf.           |
| 6    | Market Cart | Spend one loaf for coins and renown.               |
| 7    | Expand      | Spend coins to open the fourth Meadow Plot.        |

## P0 state and numbers

| Element        | Initial state       | Rule                                        |
|----------------|---------------------|---------------------------------------------|
| Plots          | 3 open / 1 locked   | Fourth plot costs 30 coins.                 |
| Sunseed        | Infinite            | Prototype convenience; no premium currency. |
| Grainleaf      | 0 / capacity 8      | A full inventory gives feedback.            |
| Meadow Loaf    | 0 / capacity 4      | One output per Crumbworks job.              |
| Market Cart    | Needs 1 Meadow Loaf | Rewards 24 coins and 1 renown.              |
| Coins / Renown | 12 / 0              | Renown is display-only in P0.               |

## Interaction and UI acceptance

- Original 720 x 1280 portrait Control screen: resource bar, central town board, and bottom action/status area.
- Emoji placeholders and project-owned SVG badges support the cards; no external or generated raster art is allowed.
- Mouse and touch share the same input path. Every visible control must provide a state change or concise feedback.
- Early collection, insufficient materials, full inventory, locked plot, and busy workshop each explain why the action cannot finish.
- Motion is optional, interruptible, and visual-only; reduced-motion-safe state changes remain clear.

## Acceptance and evidence

| Area         | Required evidence                                                                                      |
|--------------|--------------------------------------------------------------------------------------------------------|
| Happy path   | Fresh run completes plant -> grow -> harvest -> process -> collect -> order.                           |
| Rules        | Early claims and invalid actions leave state intact and show feedback.                                 |
| Expansion    | After two orders, the fourth plot changes from locked to interactive.                                  |
| Interaction  | Visible controls are checked at center and edges; pointer/tap targets match visible bounds.            |
| Verification | Headless model test plus normal Godot launch; capture confirms original emoji/SVG UI.                  |
| Boundary     | Runtime reads only the checked-in F-001 CSV; no external or generated raster asset enters the project. |

## Non-goals and next decision

- No commercial-game replication, branding, external art, raster generation, monetization, premium currency, social systems, persistence, or networking.
- No map, rail, or long-wait systems; P0 focuses on one original observable loop.
- After playtest, decide whether the 6s/5s cadence, plot readability, and original post-emoji art direction merit a second feature slice.
